

## Investigation Summary Report

Private Residence

Benton, LA

### HISTORY

Date of Investigation: February 27, 2010

Participants: James Palmer, Abby Ford, John Combs

NOTE: The owners of this home have requested confidentiality. Some information in this report may have been obscured to honor this request. This in no way affects the data presented, or any conclusions herein.

### BACKGROUND

The clients, as well as visitors to the home, have experienced shadows in the hallway and laundry area. The children's closet has a heavy atmosphere, and the door has been both opened and closed when no one was available to do so. When examined, the door exhibits no tendency to do so on its own, nor to be affected by normal air currents. Lights and various electronics have been turned on and off, with no one around to do so. Footsteps and voices have been heard in the living area by various witnesses. There have been audible knockings on the master bedroom walls, when no one was in that area of the home. The clients have gathered a large amount of EVP, the voices seeming consistent with "EVP voices". This EVP evidence, as it was not gathered at the time of the investigation, is not considered in the conclusions of this report.

EQUIPMENT: Infrared digital video system/cameras. Digital still cameras, Various EMF meters including Tri-field, Various digital audio recorders, Motion detectors, Digital thermometers, and PEAR REG-1 units for detection of anomalous consciousness with Hewlett Packard computers.

### INVESTIGATION

At the time of testing, and in the places tested, no data of evidentiary quality was gathered on video or still photography. No anomalous motion, hot spots or cold spots, unusual magnetic fields, or electronic voice phenomenon was gathered. One personal experience was noted. All 3

investigators, while in the living area, heard a toilet seat and lid slam down in the main bathroom. This door was closed, and the sound was extremely loud, even through the closed bathroom door. The seat/lid was immediately examined. It normally leans back toward the tank, and would not have fallen down without some type of interaction. Dropping the seat did not produce the loudness that was heard during the initial slamming of the seat down. No natural explanation could be discerned. Even if the seat had not earlier been leaning completely back in the normal position, allowing gravity to drop the seat, the extent of the noise could not be accounted for.

## PEAR ANALYSIS

This type of analysis is passive in nature. A total of 26 tests were run at various times during the investigation, throughout the home, in otherwise empty, closed-off rooms. Four of the 26 tests were anomalous. By the minimum acceptable reporting standards of .05, the testing could expect to possibly produce one test due to chance alone. The mean of the four tests was .02993, at about 40% below the normal reporting standard, sufficient to bolster the credibility of the scores. The areas that tested positive and the probability scores are as follows:

BR#3	Z: 2.177	P< .01474
BR#3 -a	Z: 1.663	P< .048156
Closet -3	Z: 2.069	P< .019273
Closet -4	Z: 1.780	P< .037538

The probability for these four scores being due to “chance only” and not the presence of an anomalous consciousness operating through quantum tunneling is .0000005135.

## CONCLUSION

Although the interactive data, at the times and places tested, was not positive, the amount of passive data gathered was statistically significant. This is indicative of a possible anomalous presence, consistent with the EVP gathered by the clients, being present, but choosing not to interact. If given the chance by the clients, La. Spirits would like to continue the research at this residence, and possibly, through familiarity of multiple visits, be able to gather interactive data.

We at La. Spirits would like to thank the clients for their invitation, and their gracious hospitality, and hope we can return for additional studies and research.

Thank you,  
John Combs
