

Investigation Summary Report

Private Residence

Bossier City, LA

HISTORY

NOTE: The client in this report has requested confidentiality. Some references in this report may have been obscured to protect the client's privacy. This in no way alters the data or conclusions herein.

DATE: July 18, 2009

PARTICIPANTS: La. Spirits investigators Crystal Vines, Bess Maxwell, Tricia Grayson, Kirk Cormier, and John Combs

BACKGROUND

The property is a rental home in Bossier City, with the current tenant in residence about 6 to 8 months. The actual history of this home is unknown and unknowable for knowledge that may pertain to claims of paranormal or unusual activity. While in residence, the tenant and his wife have experienced voices, shadow forms, animals alerting to the unseen, object displacement, and one unusual event involving an air freshener. Client indicates that his wife and daughter were in the bathroom when the air freshener began to spray randomly. This was interpreted as malfunction, and the batteries were replaced. It continued the random emissions. It was replaced with the one from the living room, of the same make. The replacement freshener began random emissions, and those batteries were replaced. The random activity continued in the bathroom, but the original freshener moved to the living room did not emit randomly in the living room. A series of replacing the two freshener's positions ensued. The unit in the bathroom randomly sprayed, and the unit in the living room always performed per manufacturer's design. The client himself began to try to converse with the unit in the bathroom, asking for a response of one spray for yes, two for no. The response time was consistent with the normal for a response to his questions, and no random sprays, not consistent with the questioning procedure, were observed during this interaction. This interaction was observed by the client, his wife, and their daughter, who attest to the general nature of the phenomenon as reported herein. After the questioning ceased, the units began to function normally. The client did swap out the units after the questioning, and no additional malfunctions or emissions were observed, other than those of manufacturer's design specifications for spray times. The questioning procedure is consistent with that used by paranormal investigators, using K-2 meters, or flashlights, for interaction

with an alleged or suspected anomalous consciousness.

EQUIPMENT: Digital Infrared cameras and DVR system, digital still cameras, EMFmeters including Tri-Field, various digital audio recorders, motion detectors, digital thermometers, and PEAR REG-1 unit for consciousness detection and Hewlett- Packard computer for data recording and analysis.

INVESTIGATION

There were no unusual observances made on video or still photography. No EVP was gathered or ascertained. No cold spots were detected at time of testing. No anomalous EMF magnetic disturbances were detected at time of testing, except as noted further. Interaction/communication was attempted with the air freshener as had been reported by the home owner. Interaction did not take place at any time during the attempts.

At about 10:15 PM, investigator Kirk Cormier, seated in the kitchen, inside the door leading into the living room, and staring into the living room registered that the ceiling fan blades were turning, possibly too slowly even for low speed. In speaking to the client, the client indicated the he had turned the fan off approximately 15 minutes before. Kirk was seated just inside the kitchen and would have observed any one turning the fan back on. Inspection of the switch revealed that the switch was in the off position. The switch appeared to be in proper operating condition. The investigator manually stopped the blades, and they did not resume turning. The investigator had been observing the blades turning for approximately 10 minutes, with the switch off. Restarting the fan, and turning the switch back off did not allow the blades to continue to rotate more than about 30 seconds. The air vent was not able to turn the blades, even when vents in other areas were closed to increase wind speed in the living room vent. EMF reading revealed am spot about three feet in diameter, just inside the front door with an anomalous 8.0 reading, lasting several minutes. There were no electrical appliances or wiring that could have caused the anomaly. Reading was made with a Tri-field meter. The REG-1 unit was set up in the living room, at the area of the EMF reading and three studies made. The results are as follows:

Livingroom 1 (10:45 P.M.)	Mean Score z= 1.739 Peak Score z= 2.0606	p< .041017 p< .019699
Livingroom 2 (11:05 P.M.)	Mean Score z= 1.709 Peak Score z= 2.633	p< .043725 p< .004232
Livingroom 3 (11:53 P.M.)	Mean Score z= 2.751 Peak score z= 2.755	p< .002971 p< .002935

The probability of the three graphs collectively being not anomalous, chance events only, are as follows:

Mean Score, Collective: p< .000005337
Peak Score, Collective: p< .0000002448

CONCLUSIONS

The client is known to this investigator both personally and professionally, and the client is an investigator in his area of expertise. Having performed environmental investigations at prior times with this individual, I believe his powers of observation to be both keen and acute. Therefore, I credit his physical observations as reported to me to be accurate as he perceived them. I see two possible theories of events as perceived.

ONE: The only data gathered was that as described during the ceiling fan/ EMF reading / REG-1 detection phenomenon. The evidence point to the possibility, at the time of testing, that there was an anomalous presence in the living room area.

TWO: The client's step-daughter had recently moved back into the home with the client and his wife. The child is female, and approximately nine years of age. She had, for several years, lived with her aunt about 90 miles away. Moving, changing schools, friends, and other changes in her life could have provided the tension necessary for mild poltergeist activity. The beginning of the activity, and the time of its subsiding, along with the timing of the move, coincide to support this possibility.

If conclusion two has merit, the activity probably will not return. If conclusion one is correct, activity could be cyclical. The client has been urged to contact La. Spirits for follow-up, should this be the case.
