

Investigation Summary Report

Private Residence Jennings, LA

HISTORY

Due to the fact that the current homeowner did not know of any history connected to the home, Elissa, Jennifer, and Carla decided to begin researching the home and property on their own. Unfortunately, due to renovations at the court house, all documentation that could have revealed some of the property's history was safely packed away in storage.

ACTIVITY

The homeowner has lived in the residence for about two years now and has had activity for the last 1 1/2 years. It primarily began when her daughter and young grandchild moved in with her. Her daughter reported hearing strange noises/music and getting brushed on the shoulder several times. Most often, the activity seemed to surround her young grandchild, as the toddler would

often appear to be acknowledging something that wasn't there. Once the home owner's daughter and grandchild moved out, she noticed a decrease in activity, only to have it pick back up when they would visit.

INVESTIGATION

Being the home was very small, the investigation was kept to a minimum, with only 3 investigators and several handheld cameras, EMF meters, and voice recorders. The night began normal, with no substantial evidence. The ladies then decided to try using one of the grandchild's stuffed animals, placing it on the bed, in the hopes of using it as a control object of sorts. Amazingly, it wasn't much longer after that, the investigators heard strange noises from other rooms, the faint sound of music in unknown areas, and on several occasions, the feeling as if the bed was moving. This was also accompanied with mild dizziness and uneasy feelings.

The evidence analysis produced several interesting audio clips, which we will leave for you to determine their meanings. We have already spoke with the homeowner about a follow up investigation very soon. However, this time, we will conduct the investigation with the home owner's daughter and grandchild are present. We all feel that there will be an increase in activity when they will be present, and we hope we can obtain some valid proof to back up this hypothesis. Please stay tuned, as the follow up will take place very soon!
